DRAFT: PENDING HUMAN REVIEW

TEST PLAN - SCRUM-5

Auto-Assignment of Created Cases to Available Agents

Round-robin distribution for newly created support cases

0 Ticket snapshot

Field	Value
Key	SCRUM-5
Summary	Auto-Assignment of Created Cases to Available Agents
Issue type	Task
Jira status / priority	To Do / Medium
Components / labels	None specified
Fix version / sprint	None specified
Linked issues / attachments	None specified
Fetched	27 Oct 2026 via configured Jira REST API v3

User story

As a **Support Operations Manager**, I want newly created cases to be automatically assigned to available agents using a round-robin method, so that workload is distributed fairly and cases are handled efficiently without manual intervention.

Acceptance criteria (condensed from ticket)

#	Area	Criterion
AC1	Automatic assignment	A newly created case entering the system is automatically assigned to an eligible agent.
AC2	Round-robin	Allocate cases in round-robin order and distribute evenly among eligible agents.
AC3	Availability	Check Active status, working hours, Vacation / Out of Office, and Inactive / Disabled status before assignment.
AC4	Exclusion	Do not assign to Vacation, Out of Office, inactive, or offline agents (if applicable).
AC5	Fallback	If none are available, keep the case in queue and expose it in the Unassigned tab under Case Management to Supervisor / Admin.

Source constraint The issue does not define rotation order, the "even" distribution measure, schedule boundaries, or queued-case recovery; these remain questions, not assumed behavior.

1 Scope & Objectives

In scope

- Automatic assignment when a new case is created and an eligible agent is available (AC1).
- Round-robin distribution across eligible agents, subject to confirming order and fairness (AC2).
- Eligibility checks for active state, working hours, Vacation / Out of Office, Inactive / Disabled, and offline where applicable (AC3-AC4).
- No-agent fallback: retain the case and expose it in Case Management > Unassigned to Supervisor / Admin roles (AC5).
- Focused regression of existing case creation/routing paths once the affected surface is identified.

Out of scope unless confirmed

- Skill-, region-, priority-, or SLA-based routing not stated in SCRUM-5.
- Manual reassignment, notifications, reporting, or historical-case migration.
- Load targets, rollout flags, and rollback behavior; the ticket does not specify these.

Objective

Show with evidence that eligible cases are assigned automatically and fairly, ineligible agents are excluded, and the fallback remains visible. P0 scenarios must pass; open allocation and availability rules require stakeholder decisions.

2 Requirement checklist result

2	7	13
Present	**Ambiguous**	**Missing**
of 22 items	of 22 items	of 22 items

Ratings use only what is explicit in the Jira issue. Ambiguous and missing items are recorded with author questions.

2.1 Requirement checklist

Area	Checklist item	Result	Evidence / question to author
Functional	Clear user story / goal	Present	Support Operations Manager and outcome are stated.
Functional	Acceptance criteria are testable	Ambiguous	Define measurable fairness, eligibility, and pass/fail behavior.
Functional	Happy path fully described	Present	New case is assigned to an eligible agent; trigger timing is not stated.
Functional	Negative / error paths described	Missing	What if assignment or agent-status lookup fails?
Functional	Boundary & empty states	Ambiguous	Clarify zero/one eligible agent, working-hours boundaries, and changing pools.
Functional	State transitions enumerated	Ambiguous	Define created, assigned, queued, and later reprocessed transitions.
Data & environment	Test data specified / derivable	Missing	Provide agent states, schedules, and representative case data.
Data & environment	Environment / configuration / flags named	Missing	Name QA environment, schedule configuration, flags, and build.
Data & environment	External dependencies listed	Missing	Identify case, presence, schedule, assignment, and queue dependencies.
Data & environment	Preconditions / setup stated	Ambiguous	How is a case considered "in the system"; how are states configured?
Non-functional	Performance / load expectations	Missing	What assignment latency and case throughput targets apply?
Non-functional	Security / authorization	Ambiguous	Specify who can view or act on unassigned cases.
Non-functional	Accessibility expectations	Missing	Are accessibility requirements applicable to the Unassigned view?
Non-functional	Internationalization / localization	Missing	Which locales, time zones, holidays, and working-hour calendars apply?
Non-functional	Audit / logging / observability	Missing	Which assignment decisions, exclusions, and failures must be recorded?
Cross-cutting	Impact on existing features	Missing	Which case routing, manual assignment, or reporting paths need regression?
Cross-cutting	Backward compatibility / migration	Missing	Are existing cases or stored schedules affected?
Cross-cutting	Mobile / responsive / browser matrix	Missing	Which browsers/devices apply to Case Management > Unassigned?
Cross-cutting	Rollback / feature-flag behavior	Missing	Is release gated; what happens to queued cases after rollback?
Clarity	No ambiguous wording	Ambiguous	Define "evenly", "offline (if applicable)", and "available".
Clarity	Terms defined consistently	Ambiguous	Are Active, Inactive, Disabled, offline, Vacation, and OOO distinct?
Clarity	Mockups / designs linked and match text	Missing	Provide approved design/workflow for the Unassigned tab.

3 Gaps & Questions for the author

Resolve these decisions before finalizing detailed cases. The ticket does not provide enough information to infer the intended behavior.

# / Area	Finding	Question to author
G-01 Round-robin	Order, next-agent cursor, fairness window/tolerance, and pool-change behavior are not defined.	What is the exact rotation rule, and how is "even" measured?
G-02 Agent eligibility	Authoritative state source, freshness, and conflicting-state precedence are unspecified.	Which data source is authoritative, how fresh must it be, and which state takes precedence?
G-03 Working hours	Timezone, boundary inclusivity, weekends, holidays, and overnight shifts are unspecified.	Which calendar/time zone applies, and are schedule start/end instants eligible?
G-04 Offline state	The ticket says offline "if applicable" without identifying applicable states.	Does offline mean not assignable, and what exact presence states represent offline?
G-05 No-agent queue	Access policy, ordering, and handling when an agent becomes available are not described.	Can Supervisor/Admin only view or also assign? How are queued cases ordered and resumed?
G-06 Failure / retry	Lookup or assignment failures and retry behavior are not stated.	Should failures retry, and how are duplicate or partial assignments prevented?
G-07 Concurrency	Simultaneous case creation and changing availability are unspecified.	How should concurrent assignments be serialized to preserve fairness and prevent loss/duplication?
G-08 Quality / rollout	Performance, audit, regression, environment, flags, and rollback are absent.	What latency/volume, audit, environment, regression, and rollout requirements apply?

Planning constraint Do not treat performance, security, accessibility, or recovery outcomes as acceptance requirements until the owner confirms expected behavior.

4 4.1 Test scenarios (1 of 2)

ID	Priority	Type	Scenario and expected result	Maps to
TS-01	P0	Positive	Create a case with multiple eligible agents; confirm automatic assignment to an eligible agent.	AC1
TS-02	P0	Distribution	Create successive cases with a stable pool; compare allocation with approved rotation and fairness rule.	AC2 / G-01
TS-03	P1	Boundary	With one eligible agent, create multiple cases and confirm each is assigned successfully.	AC1-AC2
TS-04	P1	Pool change	Change eligibility between cases; verify assignment uses the current pool and approved cursor rule.	AC2-AC3 / G-01
TS-05	P0	Availability	Compare Active agents inside and outside configured working hours; select only an eligible agent.	AC3 / G-03
TS-06	P0	Exclusion	Mark an otherwise eligible agent Vacation; confirm exclusion from assignment.	AC3-AC4
TS-07	P0	Exclusion	Mark an otherwise eligible agent Out of Office; confirm exclusion.	AC3-AC4
TS-08	P0	Exclusion	Set an agent Inactive or Disabled; confirm it cannot receive a case.	AC3-AC4

Priority legend P0 = core / release blocking - P1 = important behavior - P2 = supporting regression. Priorities are proposed; Jira does not define them.

4 4.2 Test scenarios (2 of 2)

ID	Priority	Type	Scenario and expected result	Maps to
TS-09	P1	Offline	Set an agent offline; verify exclusion after offline-state applicability is confirmed.	AC4 / G-04
TS-10	P1	Time boundary	Create cases at working-hours boundaries after timezone and schedule rules are specified.	AC3 / G-03
TS-11	P0	Fallback	Make all agents unavailable; confirm case remains queued and appears in Case Management > Unassigned for Supervisor/Admin.	AC5
TS-12	P1	Authorization	Verify Supervisor/Admin access; verify other-role denial only if policy is confirmed.	AC5 / G-05
TS-13	P1	Concurrency	Create cases concurrently; check duplicate ownership, lost cases, and agreed round-robin behavior.	AC1-AC2 / G-07
TS-14	P1	Retry	Repeat processing of one case event; verify stable single assignment after retry rules are approved.	AC1 / G-06
TS-15	P1	Recovery	Restore an eligible agent after a case is queued; verify agreed queued-case handling.	AC5 / G-05
TS-16	P2	Regression	Recheck identified adjacent case creation/routing paths after regression scope is confirmed.	G-08

Priority legend P0 = core / release blocking - P1 = important behavior - P2 = supporting regression. Priorities are proposed; Jira does not define them.

5 Test Data & Environment

Item	Plan / current information
Environment / build	Not specified in SCRUM-5; confirm QA environment and build before execution.
Agent pool	Prepare agents covering Active, Inactive/Disabled, Vacation, Out of Office, offline (if applicable), and working-hours in/out.
Case data	Use distinguishable new cases; record case ID, creation time, assigned agent, and queue state.
Roles	Supervisor and Admin are named for Unassigned visibility; confirm exact role identifiers and access policy.
Dependencies	Identify case creation, agent-presence/status, schedule, assignment, and queue services.

6 Entry / Exit criteria

Gate	Criteria
Entry	Ticket available; QA environment and data ready; owners confirmed eligibility, schedule, round-robin, and access rules.
Exit	All P0 scenarios pass; relevant P1 scenarios complete or waived; critical assignment/eligibility/fallback defects resolved; decisions recorded.

7 Risks, Resources & Timing

- "Evenly" is not measurable without the rotation rule and fairness window.
- Availability may change between eligibility check and assignment; race behavior is undefined.
- Unspecified retry and recovery behavior may leave cases queued or cause duplicate processing.
- QA, Support Operations, and product owners are needed to define agent schedules, roles, and fallback handling.

Timing: No sprint or target dates are recorded in the issue. Sequence execution after decisions: setup - core assignment/eligibility - fallback/access - resilience/regression.

8 Human Review Gate

The QA owner and product / operations stakeholders should confirm assumptions, answer blocking questions, and approve or edit this plan before detailed test cases or automation proceed.

Approval requested Confirm the rotation rule, eligibility and schedule definitions, queue access/recovery, and test environment.

QA owner / reviewer	Product / Operations owner	Date
